

EDI

Our EDI solution means that you electronically can transfer business documents as structured messages between MONITOR and your customer's/supplier's ERP system. All information exchange will take place more or less automatically.

EDI Communication

The EDI communication between MONITOR and your customer/supplier will take place over the Internet via an EDI bridge. For EDI communication between two MONITOR systems you do not need an EDI bridge. Then the communication will be made using files that are exchanged via for example an FTP server.

EDI Messages

MONITOR uses EDI messages in an internal format, which means that these messages must be converted into the required standard (for example EDIFACT). The message conversion is made via an external EDI software or VAN service. There the message will be converted from/to the standard required by the customer or supplier.

MONITOR supports the following business transactions:

The Sales Flow

- Import order
- Export order confirmation
- Import forecasts
- Import delivery schedules
- Import plans used for call offs* for example CALLOFF, KANBAN and DELJIT
- Export delivery notification
- Export invoices
- Print goods labeling according to Odette

The Purchase Flow

- Export order
- Import order confirmation
- Export forecasts
- Export delivery schedules
- Import delivery notification
- Import invoices

** The level of complexity during import of call off plans can vary a lot, and is determined from case to case.*
